

Transportation Manager—ASP NET

Cloud Computing at its best

This is the true web version of the system. You can use this version from any web enabled device including the Ipad, Iphone, BlackBerry, any smart phone, PC with internet access, Windows terminals.

All you need is a device that can connect to the web. With an authorized user name and password—you are on your way to using the system.

Regional coordination is inherent to this version. Multiple providers that wish to coordinate trips with each other can share a single database. User logins and User permission levels can ensure the visibility of only pertinent data to each user though all the collective data is stored in a single database.

Optimization can involve all available resources between all providers in calculating the most cost effective solution. With optimization and sharing of resources, a user still has the flexibility of deciding what resources they wish to share and which trips they wish to share.
